NOTES

CHEMISTRY

a If both SDMA and creatinine are within the reference interval: impairment of GFR is unlikely.

If SDMA is increased and creatinine is within the reference interval: likely impaired GFR and kidney function.

If SDMA is within the reference interval and creatinine is increased: can be due to artifact (hemolysis), fluctuations around the upper reference interval in well managed and stable kidney disease, post-prandial effects, or heavily muscled animals. Results will likely align with trended testing.

If both SDMA and creatinine are increased: acute, active or chronic kidney injury likely.

Recommended next step: evaluation of other renal function markers and complete urinalysis. For information on recommended actions visit:
www.idexx.com/sdmaalgorithm.
