**Genotype Interpretation Form**

**Genotype N/N - CLEAR NON-AFFECTED**

The clear dog does not carry the mutation (a clear dog has two copies of the normal gene and will not pass on the mutation to their offspring).

**Genotype N/A - CARRIER**

The carrier dog has one copy of the normal form of the gene and one copy of the mutated gene (this is also referred to as being heterozygous), but it will not exhibit disease symptoms. Carriers will not have medical problems as a result. Gene mutation can be transmitted on to half of their offspring. Inform your veterinarian and consult with him/her regarding test result.

**Genotype A/A - AFFECTED**

The affected dog has two copies of the gene mutation (this is also referred to as being homozygous sick). Affected dogs will pass one copy of this mutation on to all of their offspring and should not be used for breeding. Inform your veterinarian and consult with him/her regarding this test result.

## Notes

DM-exon2: presence or absence of the c.118G>A mutation in SOD1 gene was determined by sequencing.

**NOTES**

CHEMISTRY

- a If both SDMA and creatinine are within the reference interval: impairment of GFR is unlikely.

If SDMA is increased and creatinine is within the reference interval: likely impaired GFR and kidney function.

If SDMA is within the reference interval and creatinine is increased: can be due to artifact (hemolysis), fluctuations around the upper reference interval in well managed and stable kidney disease, post-prandial effects, or heavily muscled animals. Results will likely align with trended testing.

If both SDMA and creatinine are increased: acute, active or chronic kidney injury likely.

Recommended next step: evaluation of other renal function markers and complete urinalysis. For information on recommended actions visit: [www.idexx.com/sdmaalgorithm](http://www.idexx.com/sdmaalgorithm).
